Practical Guide to Building Netlogo Models

There's only one thing to do learn the language of the fleas,
earn their trust,
and breed with their women.
And in time our differences
will be forgotten.

A Practical Guide to Building Models in Netlogo Creating the Hattield and McCoy Model

What Are We Modeling?

- Can Inter-Group Marriage End Inter-Group Conflict?
- Two Feuding Factions (the Hatfield and McCoy Families)
- Rules for Marriage, Fighting, Birth, and ...?
- Measure(s) of Conflict Level and Tolerance
- Visualization(s) of the System Dynamics

Modeling Considerations

- Keep it Simple (after all it's just an exersize)
- Not Really Spacially Explicit
- Don't Worry about Family Structure
- Forget the Effects of Economy
- No Other Kinds of Agents (e.g. no Police or Villagers)

A Practical Guide to Building Models in Netlogo Creating the Hattield and McCoy Model

Start from the Beginning

- Open a New (Blank) Netlogo Application
- Open ANOTHER Netlogo Application (to look at other code)
- Open a Browser to the Netlogo User Manual
- Save the New Model as 'Hatfields and McCoys.nlogo'
- Delete Text from the Information Tab

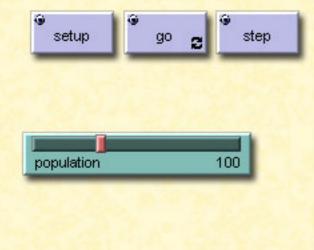

First Stept Create the Bare Skeleton of a Model

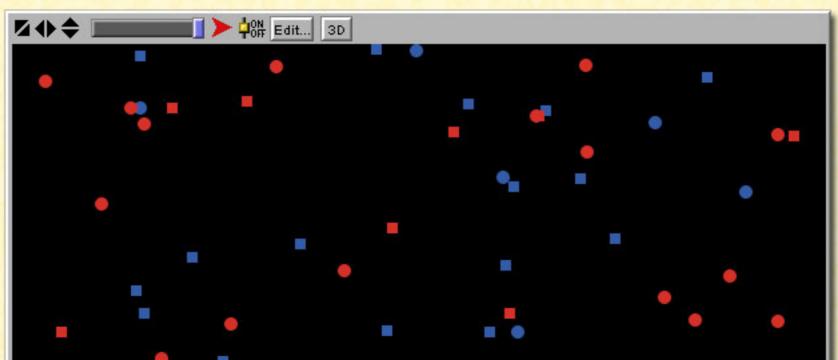

- Create a population slider (up to 300)
- Create Buttons for setup, step, and go
- Create Simple Methods for setup and go
- Create a global variable, ticker, and monitor, for time
- Set patch-size to 10 and screen-size-x and y to 30

A Practical Guide to Building Models in Netlogo Creating the Hattield and McCoy Model

Creating Agents for the Model

- Create Three Breeds: hatfields, mccoys, & tolerants
- Make Hatfields and McCoys each Half the Population
- Set Hatfields Blue and McCoys Red (and Tolerants Yellow)
- Create a turtles-own variable for alignment (0-9)
- Give Agents Sex and Set Shapes by Sex
- Set Random Initial Locations for each Agent (Hatch)

A Practical Guide to Building Models in Netlogo Creating the Hattield and McCoy Model

Agent Behavior: With Whom Do Agents Interact?

- Random Agents Physical Location Irrelevant?
- Agents on the Same Patch (using larger patches)?
- Agents within a Radius (one or all agents nearby)?
- Agents in Front of the Active Agent (using heading)?
- ...I recommend one-of turtles in radius radius (# from slider).

Agent Behavior: Actions Depend on Types

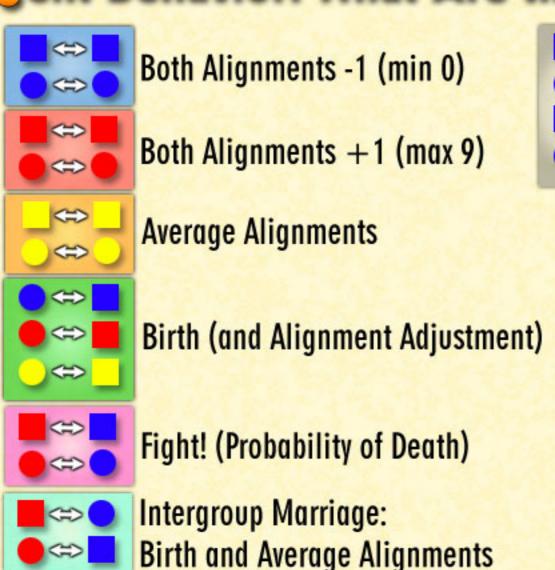

- Create Conditionals for All 21 Types of Agents (nested ifelse)
- Use Sytematic Properties to Limit Necessary Rules
- Still Need Nesting, Consider Optimal Nesting Order
- Write a Separate Method for Each Behavior
- Take Baby Steps: Minimize Change between Runnable Versions

A Practical Guide to Building Models in Netlogo

What to Do?

Average Alignments, Birth, Fight

Agent Behavior: What Are the Effects of Interaction?

A Practical Guide to Building Models in Netlogo

Creating the Hattield and McCoy Model

Improving Code: Condensing and Refining

```
to setup2
 ca
                                    Creates Turtles All at Once
 create-custom-turtles population

    Set Ratio by Making This a Parameter

   setxy random-xcor random-ycor
   ifelse random 100 > 50
     [ set breed hatfields
                                       Breed Properties Set Here
       set color blue
       set alignment 0.0 ]
     [ set breed mccoys
       set color red
       set alignment 9.0 ]
   set sex random 2

    All-Turtle Properties Set Here

   set age random 10
   ifelse sex = 0 -

    Conditional Properties Set with ifelse

     [set shape "circle"]
     [set shape "square"]
   set label sex 🝊

    Always Check Your Work

end
```

A Practical Guide to Building Models in Netlogo

Creating the Hattield and McCoy Model

Improving Code: Condensing and Refining

end

```
ask turtles [
                                          Simulates Simultaneous Updating
 rt random 90 - 45
 fd 1

    Temporarily Store the Activated Agent

 without-interruption 1
   let agentl self
                                         Eliminate "nobody" and
   if any? turtles in-radius radius [ -
     let agent2 one-of turtles in-radius radius
                                                 "agent/agentset" errors
     ;;rule for making babies
     if sex-of agent1 = 0 and sex-of agent2 = 1 [
      let baby-alignment find-average-alignment agentl agent2
      make-baby baby-alignment
                                         Can't Use != for Babies. Why?
     ;;rule for fighting behavior
                                           Method/Function takes inputs
     if (sex-of agent1 = sex-of agent2) [
      ifelse (breed-of agent1 = breed-of agent2)

    Nested Conditions to Minimize Code

        [ reinforce-alignment agentl agent2 ]
        [ fight agentl agent2 ]
                                           Model/Measure Interaction
;; to prevent run-away models that freeze your computer
if count turtles > 500 [stop]
```

Creating the Hattield and McCoy Model

Improving Code: Condensing and Refining

```
if sex-of agent1 = 0 and sex-of agent2 = 1 [
 let baby-alignment find-average-alignment agentl agent2
 make-baby baby-alignment
;;rule for fighting behavior
if (sex-of agent1 = sex-of agent2) [
to-report find-average-alignment [agent1 agent2]
   let average-alignment ((alignment-of agentl + alignment-of agent2) / 2 )
   report average-alignment
 end
 to make-baby [new-alignment]
   hatch 1 [
     set alignment new-alignment
     set sex random 2
     ifelse sex = 0
       [set shape "circle"]
       [set shape "square"]
     set label sex
 end
```

- Call Outside Functions to Simplify Code and Improve Reuse
- Can Perform Action or Calculation
- Can Take Multiple Inputs of Different Kinds
